Lab 13

In your Date class, define the subtraction operator -, What is different from your assignment 6 is, now the format is Date –Date and will return the number of days between these two dates.

For example in following example:

Date test{21,10,1994};

Date test2{20,10,1994};

int temp=test-test2;

the value of temp will be 1.

To make life easier, today we'll just implement a simplified version of subtraction, we will assume there're 30 days in all 12 months so you can ignore some very bothering things like 31 days, 28 days, etc.

However, you still need to be careful when the year and month of two date are different.
