Lab1

1, copy the following code to your VS and correct the error to make it run successfully in your computer.

```
include<iostrean>
Void keep(){char ch; cin<< ch;}
int main
[
    Cout<< 'today's lab\n'
    Cout>> 'number begin to count '
    Keep()
]
```

2, Try to create an output like following to the screen with 3 lines of cout
 One

 Two

 Three

3, Try to compress it with only one line of cout

4, Creat an output like follows(It might be very boring with only cout statement and there'll be an efficient way to do this after we have learnt loop statement.)

```
        *                   *
          *             *
            *       *
              *
            *       *
          *                 *
        *                     *
```

PS: you just need to print 3 lines of *
